

Hiring should not be a memory test.

ClearHire helps growing teams read every application fairly, explain the ranking, and close the loop with every candidate.

THE CONTROL BOUNDARY

Score merit
first.

Reveal identity
second.

Then let a human decide.

THE PROBLEM

Recruiters do not have a screening problem. They have a consistency problem.

When applications pile up, the process degrades in predictable ways.

300

applications

A realistic SME role can attract more candidates than one person can properly read.

40

CVs read

Fatigue turns a structured decision into a first-impression contest.

0

closure

The people who are rejected often receive silence instead of a clear next step.

The damage compounds downstream: scheduling takes hours, no-shows become normal, and candidate experience becomes an afterthought.

THE INSIGHT

Do not automate the hiring decision. Automate the noise around it.

ClearHire keeps judgment human while making the repeatable work structured, explainable, and fast.

01

Blind

Score only job-relevant evidence.

02

Explain

Show gaps against the rubric.

03

Reveal

Connect the score to a person only after.

04

Follow through

Schedule, remind, and close the loop.

The score is a decision aid, not a decision-maker.

THE WORKFLOW

From inbox to interview, without losing the human thread.

A single candidate record carries the process from raw CV to final conversation.

One job. One rubric. One explainable shortlist. One place to keep the promise to candidates.

BLIND BY CONSTRUCTION

The model never receives the identity fields.

This is not a blurred table. The blind boundary is enforced where the scoring

REVEAL

The score was locked
before anyone connected
it to a person.

Then:

schedule the interview · confirm timezone ·
arm reminders · compare human
scorecard · close respectfully

EVIDENCE

We built the trust story into the system.

The winning claim is not that AI is perfect. It is that the workflow is inspectable, bounded, and human-controlled.

RLS

Cross-tenant isolation

Tenant B could not read, update, or delete Tenant A's job data.

4x

Reminder cadence

2 days, 1 day, 12 hours, 2 hours, created from the confirmed interview.

JSON

Blind audit

Every scoring call records a payload containing only four job-relevant fields.

5 min

CV access

Private CV bucket with short-lived signed download links.

The human remains accountable. ClearHire makes the evidence easier to see and the process harder to forget.

POSITIONING

Not another ATS. A fairness-and-follow-through layer

ClearHire is deliberately narrow: make screening more consistent, then carry the

BROAD ATS

**Many modules. Heavy
implementation. AI as a
feature.**

CLEARHIRE

**Inbox-native intake.
Blind-score-then-reveal.
Reminders tuned for no-shows.
Human decision stays visible.**

Start with one painful role. Earn the right to become the hiring system.

A CREDIBLE START

Win the first hiring workflow. Expand from there.

The initial customer is an SME recruiter who needs speed and consistency, not another six-month implementation.

THE NORTH STAR

Every candidate gets a
fair read, a clear next
step, and a respectful
close.

The best candidate should not be the first CV opened.

Score merit first. Reveal identity second. Keep the human in the loop.

Thank you
